

Release Notes

This page contains information about releases of Quickstep.

Version 1.1.0

- First stable version of Quickstep
- Single and Parallel test execution
- Browsers: firefox, phantomjs, iphonebrowser, ipadbrowser
- Native ios app support

Version 1.1.1

- Proxy support has been added which is optional at the moment.
- Example: -Dhttp.proxyHost=<<proxyHost>> -Dhttp.proxyPort=<<proxyPort>> Also @useProxy tag must be added on feature/scenario. This is unreliable and confusing because proxy settings are applied when browser instance is being initialized and NOT before scenario execution. To turn proxy off, browser instance must be restarted without proxy settings.
- Desired Capabilities can be added to the browser now while launching.

Version 1.1.2

- JavaScript can be disabled for firefox with @javascriptoff tag in feature file.

Version 1.1.3

- ghostdriver 1.0.4 and phantomjs 1.9.2
- PageObject.ensure() refuse() wait conditions - [Examples](#)
- PageObject.brower field is deprecated and replaced by PageObject.browser() method
- PageObject.context field is deprecated and replaced by PageObject.context() method
